

Nov 3, 2020 – Nov 10, 2020	Report
Recap	• Ethics Presentation • Team Meeting
Achievements	• Ethics Presentations • Connected Pi, Arduino, and display screen to a single power source - Using portable power bank • Created a sample image of letter A - Display screen size 1280x700 • Research on resistors and breadboards • Tested sample image • Tested power button • Model design for the power, learning mode, and quiz mode button • Able to connect different images to different buttons • Completed the second major milestone in project - Created a Power Button that turns the product on and off - Able to display specific images from buttons ▪ 1st button → displays image “A” ▪ 2nd button → displays image “B”
Problems Encountered	• Displaying different images - Making images appear for a set amount of time - Making images full size of display screen • A power switch for the Pi • Change in display size is needed - Center image → should be exactly 800x800 - Display image → should be exactly 1280x800 • Power On - Have to install and build sleep functionality • Connecting the mini boards together - Larger and clunky wiring will take up more space • The sizing of power, learning mode, and quiz mode button
Future Plans	• Create full screen holographic images that will fit on display screen perfectly - 1280x800 • Connect three mini breadboards together as an extension to Arduino - Each mini board will have a button that represents a single letter - Letters A, B, and C • Connect speakers to product • Obtain sample audio files • Test sample audio files
